INSEK BEHEER / INSECT CONTROL

Bekostigbaar en effektief. / *Affordable and effective*

Frekwensies word verkieslik voorkomend gebruik om skade te voorkom, area en spesie spesifiek.

Soos gesien kan word in onderstaande grafiek van insek beheer metings op aartappelmot, gemeet met ferromoon plakkers.

Die resultate spreek vir hulself, kort na die behandeling begin is (Rooi stipple lyn) kan die skerp afname in insek getalle gesien word, die insek getalle het later weer toegeneem maar is beheer na verdere opvolg fotos ontvang is.

Frekwensies bereik insekte selfs al is hulle onder die grond of binne in plante waar gif nie kan werk nie.

Frequencies are preferably used preventative to limit damage, area and species specific.

The graph below shows insect control as measured on potato moth with pheromone stickers.

The results are self explanatory, the orange dotted line shows the start of treatment, the insect numbers grew again and after follow-up photos control gained again.

Frequencies can reach insects even underground or inside the plant where insecticides can't work.
